

A CLAUDE SKILL · WALKABLE 3D

Roam

Themes & example prompts — a field guide to the worlds you can build, and exactly what to ask Claude to build them.

github.com/wuisabel-gif/roam · early prototype

How to use Roam

Roam is a Claude skill — a folder Claude reads and follows. Once installed, you describe a world in plain English and Claude builds it as a single HTML file you can open in any browser. No build step, no setup.

1 · INSTALL

```
git clone https://github.com/wuisabel-gif/roam.git ~/.claude/skills/roam
```

2 · RESTART CLAUDE, THEN ASK

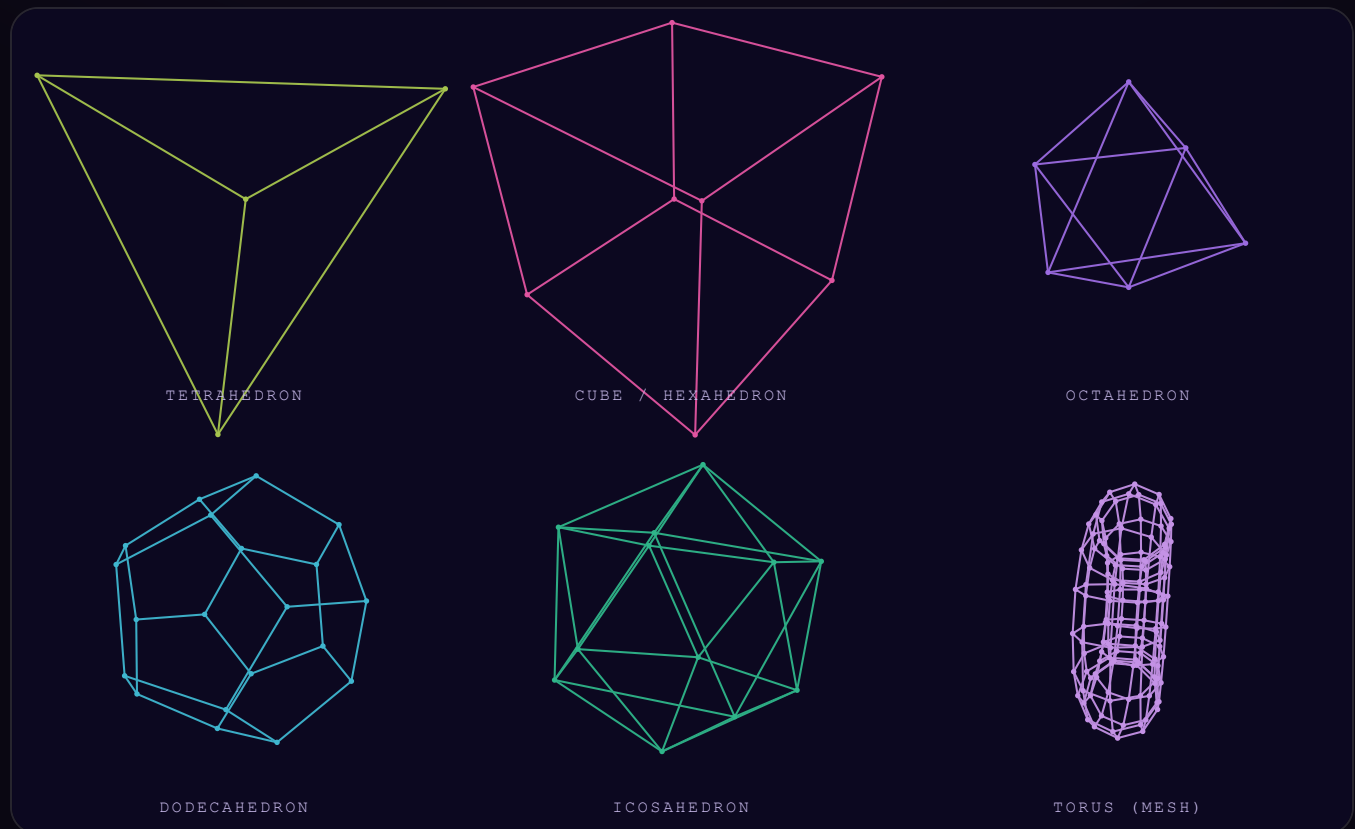

```
Use the roam skill to build a walkable 3D <your idea>.
```

Two kinds of worlds it makes

- **Corridors** — a glowing hallway of "doorway" cards you scroll through. Perfect for a *list*: portfolio projects, a music discography, a timeline, a team. (CSS-3D, zero dependencies.)
- **Rooms** — a true first-person space you walk with WASD + mouse-look: furniture, textures, even rooms hidden behind paintings. Perfect for a *place*: a gallery, a hotel, a showroom. (Three.js, still no build step.)

Geometry, rendered live

On the Roam site these shapes spin in real time with Three.js. Here are the building blocks rendered as wireframes — the five Platonic solids and a torus mesh, each just vertices and edges. The same primitives become the walls, props, and rooms of a walkable world.

Ask Claude: "use the roam skill to build a scene of slowly rotating wireframe solids on a dark background."

Themes — set 1

Neon Holographic

Dark void, glowing doorways, foil gradients, per-section color shifts. High energy.

Build a neon CSS-3D corridor of my 12 projects — glowing doorways, scroll to walk, flip each for details.

Art-Deco Hotel

1930s luxury, wood panels, gold trim, warm failing bulbs, a quiet dread.

Build a first-person Art-Deco hotel lobby I can walk, with a front desk and portraits on the walls.

Liminal Backrooms

Endless yellow rooms, buzzing fluorescents, damp carpet, the uncanny empty hum.

Build a walkable "backrooms" — endless yellow wallpapered rooms, flickering ceiling lights, no exit.

Quiet Museum

Pale walls, soft daylight, framed works, calm serif type. Let the art breathe.

Build a first-person gallery with 8 of my photos framed on white walls, wooden floor, a bench.

Themes — set 2

Cyberpunk Alley

Rain-slick neon, kanji signage, steam, reflective ground, magenta & cyan haze.

Build a walkable cyberpunk alley at night – neon signs, wet reflective floor, fog, synth hum.

Cozy Library

Warm lamplight, oak shelves, rugs, a fireplace glow. Soft and inviting.

Build a cozy first-person library room – shelves of books, a reading chair, a fireplace, warm lamps.

Space Station

White panels, blue glow strips, a window to stars, sterile hum. Clean sci-fi.

Build a walkable space-station corridor – white panels, blue light strips, a viewport of stars.

Ancient Temple

Stone, torchlight, carved reliefs, drifting dust, deep shadow. Mysterious.

Build a first-person ancient temple hall – stone columns, torches, carvings, dust in the light.

Vaporwave Mall

Pastel pink & teal, marble, palms, chrome, an empty 80s plaza. Dreamy.

Build a walkable vaporwave mall – pastel marble, fake palms, chrome, an empty fountain.

Pixel Dungeon

Low-res textures, blocky geometry, torch sprites, chiptune. Retro game feel.

Build a walkable pixel-art dungeon – blocky stone rooms, torches, a treasure chest.

Example prompts

A CORRIDOR FROM A LIST

Use the roam skill to build a CSS-3D corridor of my 10 favorite films. Each film is a glowing doorway with its poster; scroll up to walk forward; flip a doorway to read my one-line review; a HUD names the film I'm nearest. End with a gate into a grid of all 10.

A ROOM YOU WALK

Use the roam skill to build a first-person Three.js art gallery. White walls, oak floor, 8 framed paintings (I'll drop the images in an /art folder), soft daylight, a bench in the middle. WASD + mouse-look, and a non-3D fallback list of the works.

A HIDDEN ROOM (THE SIGNATURE MOVE)

In that gallery, make the 3rd painting a portal: when I walk up and click it, fade to black and step me into a small hidden study behind it — a desk, a lamp, a chair — with a "leave" marker to return to the gallery.

Tips for great-looking worlds

- **Textures must tile.** When you generate wallpaper / floor / rug art (ChatGPT, etc.), say: "*seamless tileable, square, flat even lighting, no shadows, no borders.*" A product photo on a grey background will **not** tile.
- **Furniture = .glb models.** Image generators make 2D pictures, not 3D. For real 3D props, use **Meshy.ai** or **Tripo** (image-to-3D or text-to-3D, free tiers). Drop the .glb in your assets folder and tell Claude.
- **Grey model?** Free image-to-3D exports often arrive untextured. Tell Claude to *tint* it a flat color (sofa, wood) or *wrap* it in the original reference image (a clock face, framed art).
- **Too bright?** Small rooms blow out fast. Ask for a "lighting budget": one dim ambient, one lantern that follows the camera, a couple of low accents. Cut a light's *intensity and range* first.
- **One color per section.** For corridors, keep each section's accent on a single hue variable so the whole palette re-themes from one number.
- **Always ship a fallback.** Ask for a plain HTML list of the contents for reduced-motion / low-power / screen-reader users. WebGL is invisible to assistive tech.
